

IN THE ABSTRACT:

The following paragraph will replace all prior versions of itself in the abstract of the application.

A micro terminal for inspection or installation with high connection reliability is provided at lower cost. A micro terminal (~~91~~) according to the present invention has electrical conduction between the micro terminal and an electrode of an electronic device or an inspection device and includes a columnar contactor (~~91a, 91e~~) in contact with the electrode. The contactor (~~91a, 91e~~) has a spring structure which is elastically deformed when pressed against the electrode. The contactor (~~91a, 91e~~) includes a protrusion (~~1t~~) protruding outwardly at its end in contact with the electrode and the shape of the protrusion (~~1t~~) has a part of a sphere or a part of a paraboloid of revolution.
